Smart Waste Management System For Metropolitan Cities

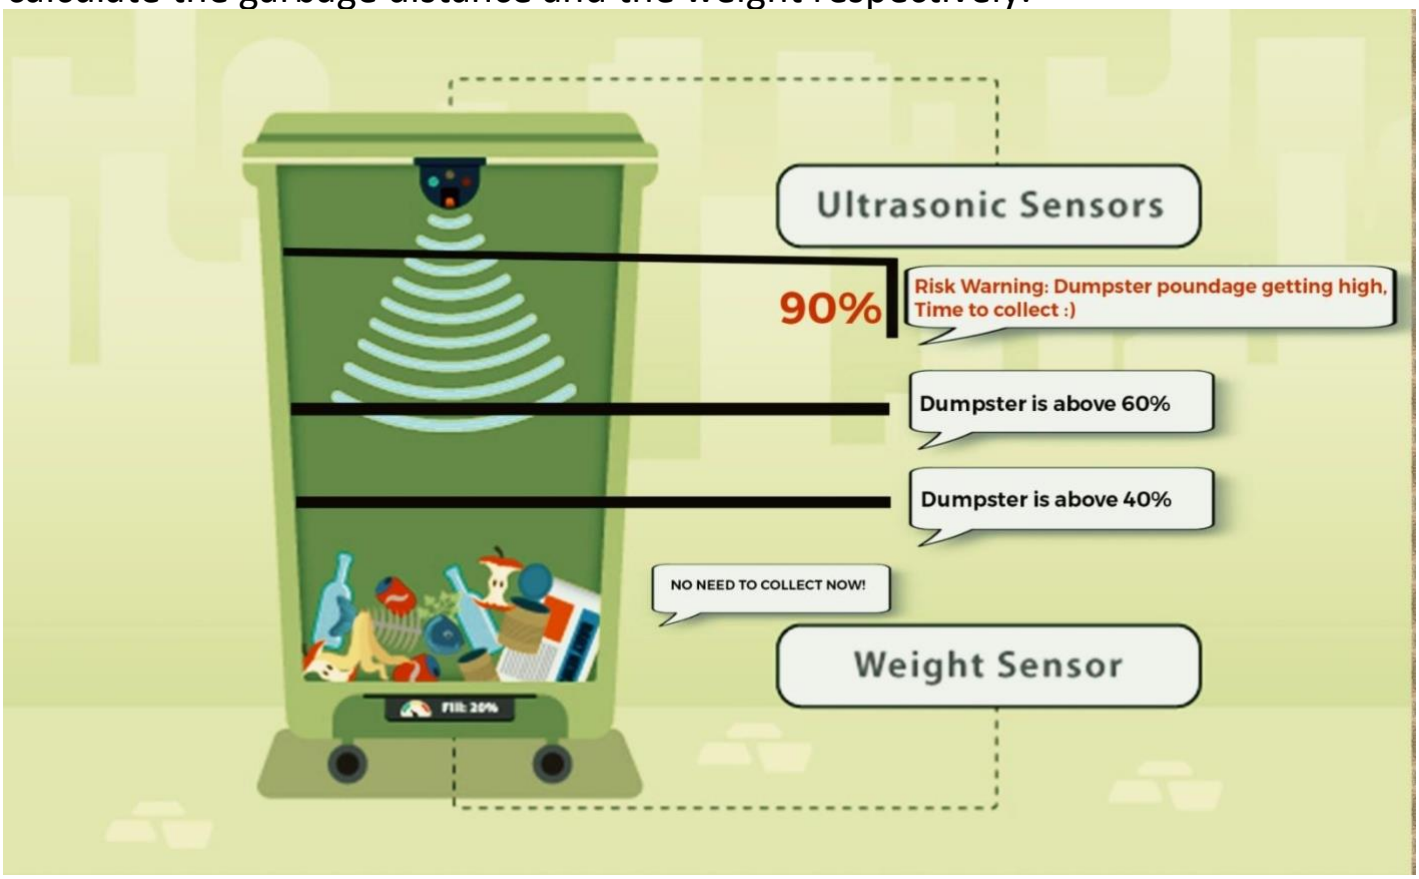
DESIGN AN WEB PAGE :

PARAMETERS ARE:

1. **DISTANCE**
2. **WEIGHT**

PROJECT MODEL :

The ultrasonic sonic sensor and the weight sensor which are used to calculate the garbage distance and the weight respectively.



There are certain assumptions assumed by us, They are

- The length of the trash can is assumed to be 200 cm.
- The maximum weight of the can is assumed to be 2 Kg.
- If the garbage distance goes more than 180cm i.e more than 90% of the trash can , the sensor is has to send to send an alert to the garbage collector.
- If the alert is received , then the garbage collector has to come and collect the garbage.
- The current weight and the garbage distance is to be updated periodically, i.e for 5 minutes.

Webpage code:

```
<!DOCTYPE html>
<html>

<head>
  <style>
    .container{
      text-align: center;
      b
      o
      r
      d
      e
      r
      :

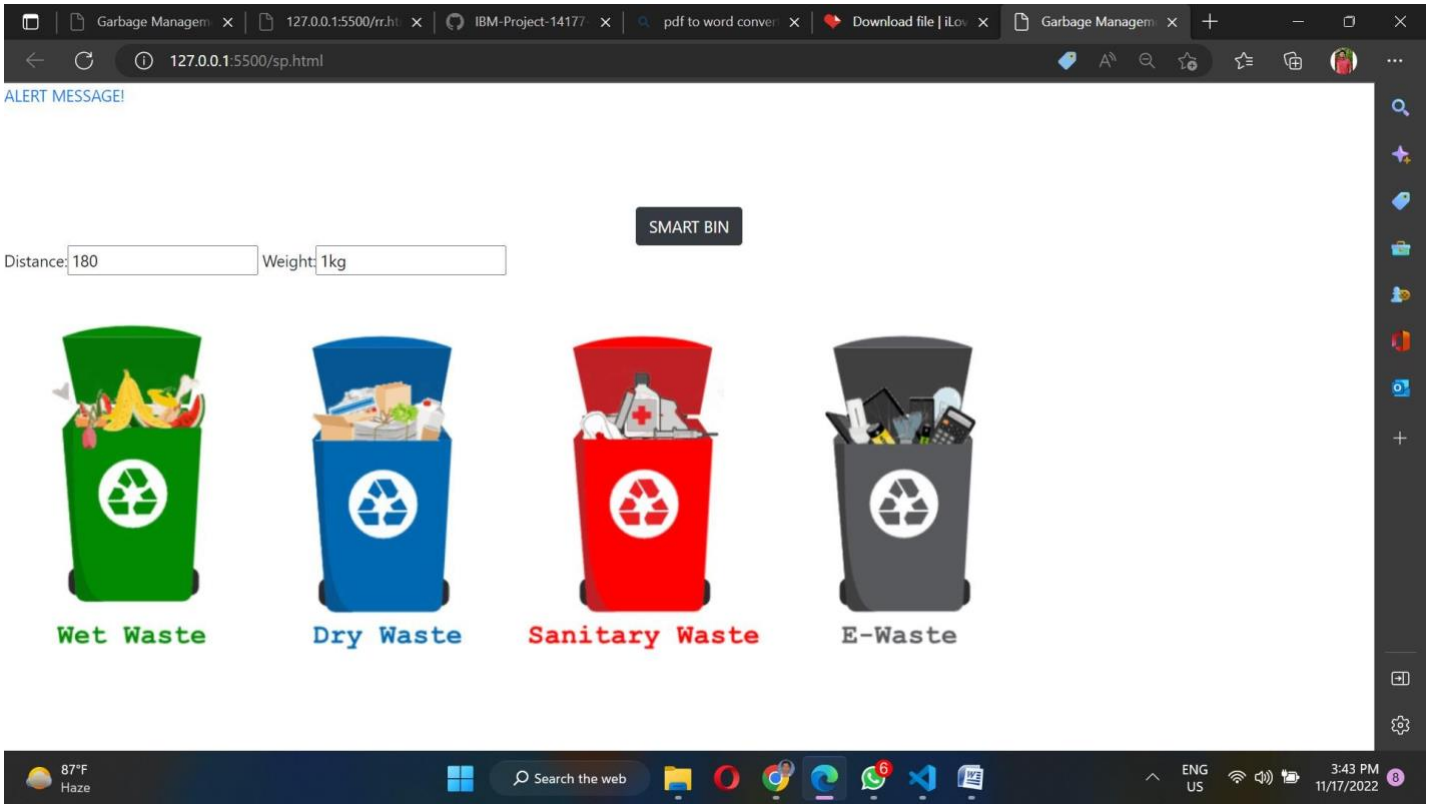
      7
      p
      x

      r
      g
      b
      (
      2
      5
      5
      ,
```

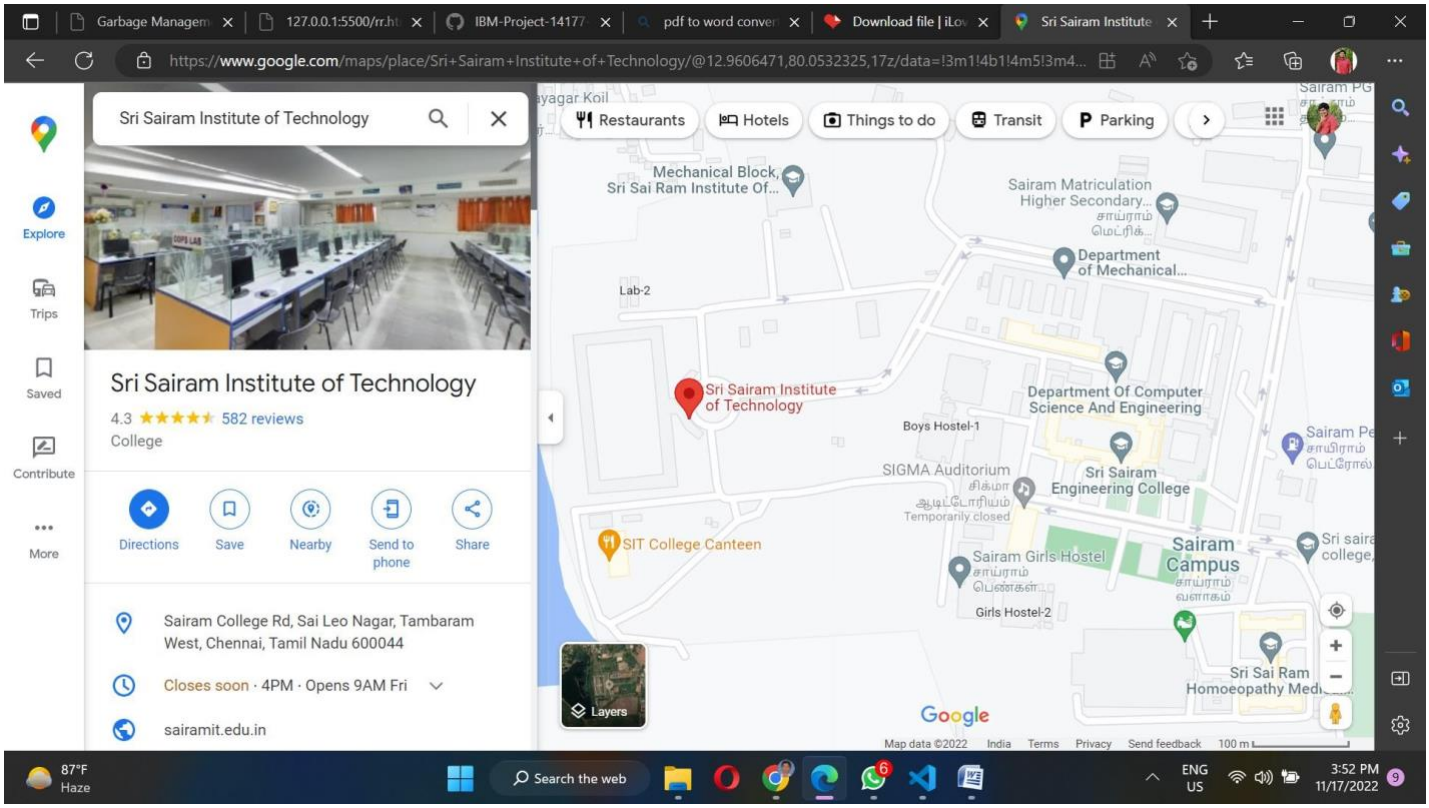
```
<center><a href="https://g.page/sairamengg?share"
  type="button" class="btn btn-dark">SMART BIN</a></center></div>
  <form>

      D
      i
      s
      t
      a
```

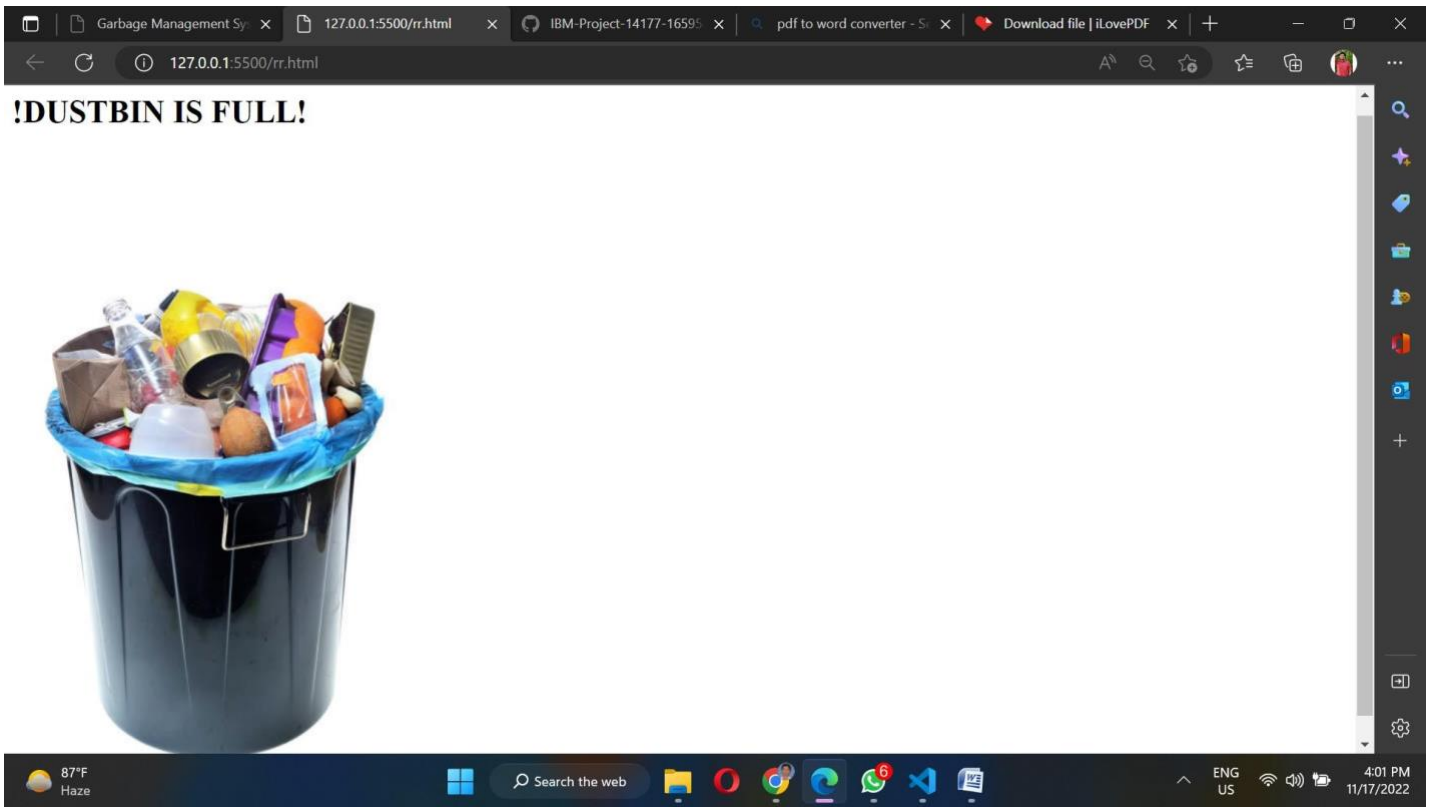
Output :



When you click the smartbin button it will show the exact location where the garbage can is filled.



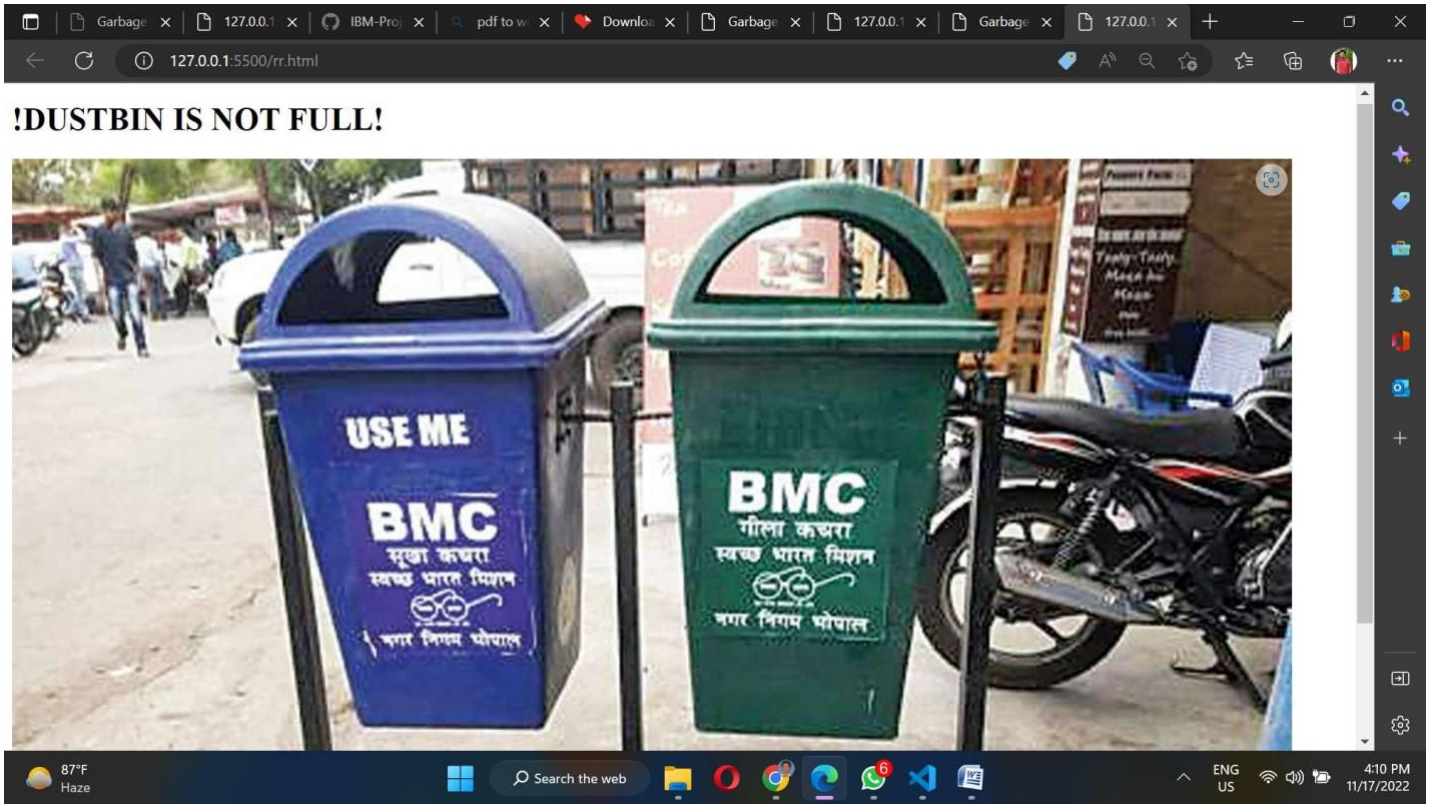
When dustbin is filled:



When the smartbin is filled the alert message will be sent to the garbage collector along with the exact location with its co-ordinates .

When the garbage is not filled upto 90% the smartbin is ready to collect the garbage.

When dustbin is not filled:



We are sending the data of the garbage can with help of Node-red and iot cloud which composed of the value equal to the weight of the garbage can and the distance of garbage present in the can.
